Extra Thin Wall cannula

Optimised drug flow

Larger inner diameter with an unchanged outer diameter³

- Improved medication through greater flow rate¹
- Due to the larger inner diameter of the cannula, less force is required when pushing the injection button¹
- Supports the simple delivery of highly concentrated insulins from 200 Units/mL

Premium quality features

Experience reliable comfort

Advanced quality medical cannula: the 4 mm and 6 mm pen needles have a fine 32G cannula. High precision 3-bevel and premium polished pen needle tip.

Anti Coring

The special treatment removes unevenness, prevents fraying of the ground edge and enables a smooth injection.

Easy Glide

Special silicone surface treatment enables constant gliding characteristics and smooth penetration.

External protective cap with good grip. Free tear-off tab allows the sealing foil to be removed quickly.

Just two twists for a secure fit

The intuitive way to attach the pen needle²

Twist the pen needle onto the injection pen.

Make sure you do not tilt the pen needle while twisting it onto the injection pen.

Dual thread allows fast and easy fixation.

Universal twist to fit all major injection pen brands.²

Short pen needles

Reliable subcutaneous injection

To achieve a good insulin dose effect, it is essential to inject the insulin into the subcutaneous fatty tissue (subcutaneous injection) and not into the underlying muscle. Injecting insulin into the muscle can lead to unexplained fluctuations in blood glucose values as well as to severe hypoglycaemia.

- Short pen needles reduce the risk of inadvertent injections into the muscle.
- 4 mm and 5 mm pen needles simplify the injection technique. Injections can often be given at a 90 degree angle without forming a skin fold (children, adolescents and slim adults should form skin folds).⁴

- 1 Skin (epidermis and dermis)
- 2 Subcutaneous fatty tissue
- 3 Muscle

- ✓ 4 mm and 5 mm pen needles often permit safe subcutaneous injections even without forming a skin fold. Follow the recommendations given by your diabetes advisor.

- ✗ Long pen needles increase the risk of injecting into the muscle.
